(57) Abstract:

PROBLEM TO BE SOLVED: To provide a level sensor by which a level can be detected without a contact, which does not generate an error even after a long-term use and whose reliability is high.

SOLUTION: In a sensor, a level is detected in such a way that the movement of a float arm 10 to which a float 11 is attached is detected on the basis of a change in the output of a magnetoelectric conversion element 8. In this case, a detecting body A as a magnetic body is attached to the shaft part 10a of the float arm 10, the detecting body A is magnetized by a magnet 7, the detecting body A is constituted in such a way that the distance between itself and the magnetoelectric conversion element 8 is changed according to its angle of deflection, and the movement of the detecting body A is detected by the electromagnet conversion element 8.
